1. Introduction

1.1 Purpose of this document

The purpose of this document is to provide a detailed description of Common Interface requirement details of the SaaS shared Training Management System (sTMS) built for administering Continuing Education and Training (CET) courses offered by the 6 IHLs, including the Institute of Technical Education, Ngee Ann Polytechnic, Nanyang Polytechnic, Republic Polytechnic, Singapore Polytechnic, and Temasek Polytechnic.

This Interface Functional Specification includes all common interfaces, Corppass, MyInfo, Unified Account Management (UAM), Staff Account Authentication Module (AAD integration), Shared LMS POLITEMALL, Blockchain (OpenCerts), SSG's Training Partners Gateway, Workday HR system, and Workday Financial system.

1.2 Intended Audience

This document is written for audiences in the sTMS project, including:

- Project sponsors and project implementation team from CET, Registrar's Office, and Finance.
- Technical and Development Team, who are responsible for finalising technical requirements, implementing detailed design, and conducting system integration, performance, and security tests.
- Interface Team, who is responsible for the information exchange between systems.

2. Corppass Integration

2.1 Introduction

This Interface Functional Specification is to provide the baseline of communication requirements between the SaaS shared Training Management System and Corppass.

The system allows company users to log in to the sTMS company portal via Corppass. To simplify the subsequent course registration process, the company user is required to fill in their basic profile information on first login, the remaining profile information can be retrieved from MyInfo business.

2.2 Overview

The diagram below shows the overview of the integration between sTMS company portal and Corppass. Upon company user login to Corppass, the system will redirect the user to Singpass portal as the Identity Provider for authentication check.

OIDC (OpenID Connect) protocol is a new standard in managing identity authorization to address complexities of working across multiple applications and clouds. It is introduced in Singpass and Corppass integration to strengthen security and streamline communications. OIDC allows sTMS to validate the identity of company users trying to access Singpass identity provider.

2.3 Business Rule

No.	Business Rule
1	The company user login to Corppass as a business user by scanning with the Singpass app or key in his/her NRIC, password, and 2FA token.
2	The company user is required to fill in Contact information and Billing contact upon the first login to the system, the remaining profile information such as company name, company type, UEN, etc. can be retrieved from MyInfo business.

Please refer to sTMS stage3 functional specification – section 10.1 Company Portal for the details of the business process for Login and My Profile.

3. MyInfo Integration

3.1 Introduction

This Interface Functional Specification is to provide the baseline of communication requirements between the SaaS shared Training Management System and MyInfo.

To simplify the subsequent course registration process, the system allows applicants and students to synchronise personal information from MyInfo, which has been verified by the government and will be saved directly into sTMS without further approval.

3.2 Overview

The diagram below shows the overview of the integration between the sTMS student portal and MyInfo.

The system will be first redirected to Singpass for authentication when the **student/applicant** login the sTMS student portal via UAM Common ID and retrieves personal information from MyInfo.

The personal information like name, mobile number can be retrieved directly from MyInfo **if the applicant login the sTMS student portal after getting authenticated via Singpass.** (This feature relies on enabling Singpass SSO)

The personal information includes Name, Date of birth, NRIC/FIN, Citizenship type, etc. Refer to sTMS stage2 functional specification – section 8.10 for all the fields.

3.3 Business Rule

No.	Business Rule
1	The system will redirect to the consent page of MyInfo to get permission from the applicant before retrieving personal information from MyInfo.
2	After the successful MyInfo API call, the applicant's personal information will be displayed on the applicant details page and is not editable. The applicant's academic certificate documents will be retrieved and displayed on the section of supporting documents on the applicant details page.
3	If the personal information differs from what is shown in MyInfo (e.g., Email address), the applicant should click on the button of sync from MyInfo to update the latest particulars to sTMS.

Please refer to sTMS stage2 functional specification - section 2.1 Applicant/Student Login for the details of the business process/rule.

4. Unified Account Management (UAM) Integration

4.1 Introduction

This Interface Functional Specification is to provide the baseline of communication requirements between the SaaS shared Training Management System and Unified Account Management (UAM, which is also known as the Common Identity System (CIS)).

sTMS provides a centralised login page for student users, company users and IHL users (Admin user and Lecturer user) to login to the respective portals. As a student or applicant, the system will firstly direct the user to UAM for authentication once the user clicks on 'Student' icon on the sTMS login page.

After authentication, UAM will redirect the student or applicant back to the sTMS system based on the return URL parameter, the http response contains the authentication token and the expiration time of the token issued by UAM. By default, the expiration time is 2 hours and can be configurable. The token should be encrypted by a specific algorithm aligned with both sides, sTMS will analyse the token for the further authorization process.

The UAM supports three authentication methods: Singpass, Student ID password and email OTP. The authentication check through Singpass will be considered as the default method.

The UAM will receive the update request from sTMS when there is a profile updated by students in sTMS. The details of the supported student profile sent to UAM can be found in sTMS stage2 functional specification – section 8.10.1.

4.2 Overview

The diagram below shows the overview of integration between sTMS student portal and UAM (both authentication and profile update).

Scenario1:

- 1.1 Student or applicant login to sTMS student portal from their device.
- 1.2 sTMS redirect student or applicant to UAM for the authentication check.
- 1.3 The UAM will connect to the Joint Azure Active Directory for the authentication completion if the student chooses the login method as student ID and password. The Singpass and Email OTP options will also be provided on the UAM authentication page.

Scenario 2:

- 2.1 Student retrieves the profile information from MyInfo or updates the profile information manually.
- 2.2 The update request will send to UAM from sTMS once all the information is verified through sTMS.
- 2.3 The information will be updated to AAD once UAM receives the request.

4.3 Business Rule

No.	Business Rule
1	The login request from the user (student/ applicant) in sTMS will be redirected to UAM for an authentication check.
2	UAM provides three authentication methods for the student and applicant: Singpass, AAD authentication and Email OTP.

3	sTMS interface with UAM for student account creation after the applicant is enrolled in the course. UAM will send the email to the student which includes the basic information for login. The information should include but not limited to Student ID, and a temporary password.
4	sTMS interface with UAM to update student profile and account status if there are any changes in sTMS.
5	UAM provides other functionalities such as resetting the password, find my student id, etc. which students can utilize on the UAM authentication page.

Please refer to sTMS stage2 functional specification - section 2.1 Applicant/Student Login and stage3 functional specification – section 2.1.2 Login to sTMS for the details of the business process/rule.

5. IHL AAD Integration

5.1 Introduction

This Interface Functional Specification is to provide the baseline of communication requirements between the SaaS shared Training Management System and IHL Azure AD.

The IHL admin users and the lecturers can login to sTMS by using the 6IHLs' Azure AD account and password. The authorization access function is also provided and can be assigned to relevant **CET and finance staff**. The portal switching function is also available for those users who need to switch between the admin and lecturer's portal after logging in.

5.2 Overview

The diagram below shows the overview of integration between sTMS **admin/lecturer portal** and IHL AAD.

The IHL admin and lecturer user will be redirected to Microsoft 365 login page once the user clicks on the **'login to admin or lecturer portal'** on the sTMS landing page. The system authentication is required by using IHL AAD account and password.

The IHL Azure AADs need to enable MFA for an additional form of identification/authentication to meet the security requirement.

5.3 Business Rule

No.	Business Rule
1	The AAD integration is only for authentication and does not retrieve any staff information from AAD. All the IHL staff profiles will be synchronised from with the Workday HR system.
2	The user does not require to choose the corresponding IHL in the CET portal, because the system can identify IHL by looking into the AAD account extension (e.g., @TP.edu.sg).

6. Polite – BrightSpace – D2L(POLITEMall)

6.1 Introduction

The Polite – BrightSpace D2L is a shared Learning Management System (LMS) platform that all learners from all 6 Institute of Higher Learning (IHLs) will use to access online learning content across multiple sectors and disciplines.

This interface shall support the operation by API for the following:

1. Interface functions: Staff user data, CET Learner users' data, module information, group information, CET Learner enrolment, staff roles and enrolment, terms/semester/runs, institutional/organizational association data
2. Operation functions: Insert, update, remove, disable/enable and **course copying**

6.2 Overview

The flowchart above illustrates the overview of the course and user Lifecycle in sTMS and the API call from sTMS to POLITEMall system for all the corresponding interactions.

There will be multiple APIs to be called at during different stages in sTMS, such as course setup, course intake creation, module and class enrollment, student registration, student graduation, staff information syncing from Workday, staff resign, etc.

In the following sections below, the interface specification would explain on the POLITEMall integration setup in sTMS, API responses feed files creation at various levels, user life cycle, API trigger Point for student enrolment statuses.

6.3 Business Rule

6.2.1 Business Rules

No.	Business Rule
1	The Interface triggering is applicable to all Full Qualification Courses (or ITE MOE Academic Course) and Short Courses. There will be dedicated UI to toggle whether given courses will be synced over to POLITEMall. For Evergreen Courses, it will be handled on case-by-case basis. Whether it's an evergreen course offering or is determined by the indicator of EverGreen in course intake setup.
2	Programme could be course or grouping based on each IHL's business needs. While used as grouping, it is less frequent changed entity in POLITEMall. The API will be triggered on a needed basis OR user could create manually in POLITEMall While used as course, when course is created or updated in sTMS, the changes should be synced over to POLITEMall simultaneously. For Full Qualification Courses and Short Courses, they follow the above-mentioned triggering logic. For Evergreen Courses, normally the programme structure is already in POLITEMall.
3	Course template refers to module in sTMS. It is part of course setup in sTMS. Once course setup is completed, module will be ready to sync to POLITEMall. For Full Qualification Courses and Short Courses, they follow the above-mentioned triggering logic. For Evergreen Courses, normally the Course Template structure is already in POLITEMall.
4	Course offering refers to module instance provided under given course intake in sTMS, for student to apply and enroll. Whenever a course intake is open for application, the corresponding modules will have a running instance under the given intake. Currently, this module instance will be created in POLITEMall as course offering. For Full Qualification Courses and Short Courses, they follow the above-mentioned triggering logic. For Evergreen Courses, some IHLs treat it the same as Short Course, and for the rest IHLs, Course Offering structure is already in POLITEMall.
5	Course Copy will normally be triggered from sTMS, at the same timing when Course Offering is created.

	This action will copy the module learning material from the pre-defined POLITEMall module offering and paste to the new module offering created for given intakes. The default source module offering typically could be either the previous offering or a pre-defined baseline offering. sTMS users need to configure while creating course intakes in sTMS.
6	Section refers to Class in sTMS. When module class enrollment is starting in sTMS, the class structure would also be created accordingly. sTMS will sync over class information and create corresponding sections in POLITEMall.
7	No IHLs require to use Course Delete API to remove the module offerings that are no longer needed as of now. However, system provides a configurable setting to enable this integration if necessary in the future.
8	There are multiple user roles in POLITEMall, mainly Learner, Tutor and Module Leader. Each IHL has their dedicated mapping roles from the sTMS user roles to POLITEMall user roles. In general, once the user account is created in sTMS, corresponding POLITEMall account will be created simultaneously. Users will be enrolled to module offering or section based on the assigned roles, responsibility, and access right. Unenrollment of different users are scenario based. Learner unenrollment could be triggered by withdrawal, deferment or completion. Tutor and Module leader unenrollment could be triggered due to position change or resign.
9	The API trigger points are based on action or scenario happened in sTMS. However, the exact timing of each API call will be per IHL basis, following their existing operation practice.

6.2.2 Front-end Configuration Page

sTMS provides the centralised configuration pages for IHL admins to manage the configurations efficiently and friendly. The pages provide the configuration for following features:

- Course Management
- Trigger Condition Management

Refer to the clickable prototype here: [POLITEMall Integration](#)

6.2.2.1 Course Management

System allows the IHL system admin to toggle whether given course will be enabled to integration with POLITEMall. If IHL system admin turn toggle off, system will not trigger the integration for this particular course anymore.

Below are the columns, data fields and available actions for this function:

Search & Filter	Description
Filters: Course category, Course type, Branch, School	By clicking the edit icon, users can change the selected options, and the records shown will be changed to only matched records.
Search	- Searchable fields: Course code, Course name. - Upon clicking search icon, the system displays all the matched results.

6.2.2.2 Trigger Condition Management

Trigger Condition Management is a function that allows IHL System Admin to define the trigger point for each integration entity. The list of trigger points is:

- General - Create Course Offering
- General - Create Section
- General - Course Copy
- General – Course Delete
- Student – Create
- Student – Enrol
- Student – Unenroll
- Student – Disable
- Lecturer – Create
- Lecturer – Enrol
- Lecturer – Unenroll
- Lecturer – Disable
- Module Owner – Create
- Module Owner – Enrol
- Module Owner – Unenroll
- Module Owner – Disable

The definition and detail for each trigger point can be referred to the 6.2.1 Business Rules section.

System allows the IHL system admin to toggle whether given entity will be enabled to integration with POLITEMall. If IHL system admin turn toggle off, system will not trigger the integration for this particular entity anymore.

For each type of integration entity, system allow IHL system admin to create multiple trigger points based the business need. The configuration follows the design for Rule Management, where can configure the Name/Description/Scope/Rule (Trigger Point)

Below are the columns, data fields and available actions for this function:

Name	Control Type	Mandatory?	Default Value	Editable ?	Description	Display on listing page?
Name	Single line of text	Yes		Yes	Indicate the name of the rule.	Yes
Description	Multiple line of text	No		Yes	Indicate the description	Yes
Section: Scope						
Select the scope to apply	Radio button	Yes		Yes	Value list: – A combination of factors – Specific courses – EverGreen courses Tooltip: Tick the checkbox to further narrow down the scope; Leave the checkbox unchecked to skip the checking. System matches the service instance to be used based on the combination: Course category, and Course type or Course.	Yes
Course Category	Checkbox	No		Yes	Specify the course categories	

					to enable the rule. Display when choosing "A combination of factors".	
	Multi-choices dropdown list	Yes, when checkbox is ticked				
Course Type	Checkbox	No		Yes	Specify the course types to enable the rule. Display when choosing "A combination of factors".	No
	Multi-choices dropdown list	Yes, when checkbox is ticked				
Branch	Checkbox	No		Yes	Specify the branch to enable the rule. Display when choosing "A combination of factors".	
	Multi-choices dropdown list	Yes, when checkbox is ticked				
School	Checkbox	No		Yes	Specify the school to enable the rule. Display when choosing "A	

					combination of factors".	
	Multi-choices dropdown list	Yes, when checkbox is ticked				
Courses	Multi-choices dropdown list	Yes		Yes	Specify the courses to enable the rule. Display when choosing "Specific courses".	No
Section: Rule settings						
X Days	Integer	Yes		Yes	Indicate the Days	No
Before or After	Multi-choices dropdown list	Yes			Indicate Before or After	No
Condition	Multi-choices dropdown list	Yes			Default value: - Course start/end date - Semester start/end date - Term start/end date - Specific period start/end date - Course intake start/end date - Course offering created date	No

					- Timetable published date - Student account created - Student enrolment status (Withdrawn, Deferred, Transferred, Suspended, Graduated) - More conditions can be constantly added base the template configured by IHLs	
--	--	--	--	--	---	--

The following buttons are added on each Rule Listing Page.

Button	Displayed on	Description
Create	Rule listing page	Upon clicking "Create", the create panel will popup.
Edit	Rule listing page	A rule can be selected and edited. Multiple rules cannot be edited at the same time. Upon clicking "Edit", the edit panel will popup.
Activate	Rule listing page	Upon clicking, system will activate the selected request. Available when a single item in inactive status is selected.
Deactivate	Rule listing page	Available when a single item in active status is selected. Upon clicking, the system opens a confirmation popup. Upon confirmation, the system changes the selected item to inactive status.

6.2.3 Back-end Configuration Template

sTMS provides a backend configuration template for each IHL to configure the mapping and trigger point for each integration feature. IHLs will need to review and complete the template for the trigger points for each entity, and then system will convert the template to a configurable design for IHL system admins to manage the trigger points.

There are 4 sheets in each excel:

Full Structure: Introduce the data structure in POLITEMall that sTMS will follow when passing over the information to POLITEMall.

Identify Couse: Provide a list of Course Category and Course Type for IHL admin to indicate the type of each course(FQ/Short Course/Ever Green(if any))

Tigger Point: Provide a list for all the API trigger points to integrate with POLITEMall for different type of courses. The condition is totally configurable in system backend.

User Role Mapping: Provide the user role mapping from sTMS to POLITEMall

Refer to the details of how the API trigger points will work for each IHL as below:

RP	TP	SP	NYP	NP	ITE
 sTMS and POLITEMall Integ	 sTMS and POLITEMall Integ	 sTMS and POLITEMall Integ	 sTMS and POLITEMall Integ	 sTMS and POLITEMall Integ	 sTMS and POLITEMall Integratio

*Please note that AvePoint is still working with IHLs to finalise the configuration template, the rules/conditions may be slightly changed based on the further alignment with each IHL.

7. SSG TPG Interface Integration

7.1 Introduction

This Interface Functional Specification (IFS) is to provide the agreed baseline of communication requirement between the SaaS shared Training Management System (sTMS) and SkillsFuture Singapore (SSG) system for students, lecturers, courses, sessions, etc. information.

7.2 Overview

sTMS will interface with SSG TPG with the certificate of SSG-WSG account/app provisioned by each IHL. Security control is implemented by the SSG API to segregate the course and individual's data among IHLs.

7.3 Business Rule

No.	Business Rule
1	IHL will onboard SSG Account and App for sTMS integration with SSG TPG
2	sTMS will retrieve the TPG course detail by Course Reference Number upon IHL's user request
3	sTMS will submit the course run to TPG when the intake status become Ready for Application
4	sTMS will call the API - Grant Calculator-Personalized to retrieve individual's grant eligibility and display the nett course fee to applicants.

5	sTMS will redirect learners to SSG SFC claim page and submit the supporting document to SSG TPG upon learner click to pay with SFC for the course
6	sTMS will update the trainee's Fee Collection Status to TPG by daily timer job
7	sTMS will submit the enrolment/session/attendance/assessment information to TPG by the date specified in system
8	sTMS will submit the make-up course run/make-up session/make-up attendance/make-up assessment to TPG by the date specified in system

Please refer to sTMS stage3 functional specification – section 2.5 TPG Solution for the details of the business process/rule.

8. OpenCerts – Digital Certificate

8.1 Introduction

This section is to provide the detailed technical design between the SaaS shared Training Management System (sTMS) and OpenCerts(Digital Certificates) platform.

The Digital Certificates use OpenCerts anti-tampering mechanism to guarantee the authenticity of each issued certificate; The certificate data with OpenCerts format certificate is in JSON format with the '.OPENCERTS' extension in the pre-defined OpenCerts 1.5 or 2.0 schema.

8.2 Overview

sTMS would consolidate and convert the certificates, also transcript data into the OpenAttestation JSON format of OpenCerts. The file will send to OpenCerts for issuance. On top

of that sTMS will email the JSON file of OpenCerts to students and interface the file with Skills Passport.

8.3 Business Rule

No.	Business Rule
1	sTMS will host the wallet and store the documents/ information for each IHL
2	sTMS will provide the Digital Template feature to map and convert the certificates and transcript data into OpenCerts OpenAttestation JSON file
3	sTMS will provide the Digital Template feature to allow each IHL to define additional JSON attributes which will be specific to their certificate and transcript templates
4	sTMS will send over the signed JSON file to OpenCerts for issuance
5	The issued certificate file will be emailed to the student and uploaded to Skills Passport
6	sTMS will revoke the digital certificate from OpenCerts upon IHL's request
7	The revoked digital certificate will be removed from both the student portal and Skills Passport

Please refer to sTMS stage3 functional specification – section 9 Graduation and Certificate Management for the details of the business process/rule.

9. Workday HR System

9.1Introduction

This Interface Functional Specification (IFS) is to provide the agreed baseline of communication requirements and detailed technical specifications between the SaaS shared Training Management System (sTMS) and Workday HR system.

This Workday HR System interface specification would be further split into two parts:

- 1. sTMS will retrieve all IHLs staff information from Workday HR System which would be the master copy for Staff Profile. Any creation and changes to staff information would be synced to sTMS timely.
- 2. Upon training/task completion on sTMS, training hours, project/program code and other necessary information would be sent from sTMS to Workday HR System for further processing.

9.2 Overview

9.2.1 Overview – Workday Staff Profile

sTMS would be retrieving all staff information from Workday HR via API. Please refer to the following for a detailed description:

SN	Description
----	-------------

1	sTMS requests Staff Information from Workday HR System daily at 12:30am.
2	Workday HR System sends the requested Staff information after receiving API authentication from sTMS.

9.2.2 Overview – Workday Training hours

sTMS would be sending all training hour information to Workday HR via SFTP. Please refer to the following for a detailed description:

SN	Description
----	-------------

1	sTMS would send the EIB report for claimable training hour to Workday HR System by API per user configured interval in Lecturer Training Hour Management module
2	sTMS would push timesheet report for the non-claimable training hour in CSV format into SFTP as per user configured interval in Lecturer Training Hour Management module. Workday HR System pulls the data from sTMS SFTP.

9.3 Integration – Staff Profile

9.3.1 Business Rule

No.	Business Rule
1	sTMS would retrieve all staff information from the Workday HR system, including both PET and CET. The process of identifying corresponding CET staff will be handled within sTMS.
2	If a staff has more than one role within an IHL or across IHLs, Workday will send all the details to sTMS, which includes multiple position IDs, emails and other relevant information. Workday will send multiple individual records for respective users if this scenario is identified.
3	There is only 1 record per staff, regardless of how many positions are held.
4	For any field included in the staff information, the following shall be applied: - Values comparison would be applied to each field on a daily basis at 12:30am. For any changes in the field values, it would include in the interface response. - For any new fields to the interface, additional logic must be added to the filter criteria

Please refer to sTMS stage3 functional specification – section 2.2 User Account Management for the details of the business process/rule.

9.4 Integration – Training Hour

9.4.1 Business Rule

The system integrates with the Workday HR system to post the record lecturer training hours over to the Workday HR system.

No.	Business Rule
1	sTMS would send all training hours to Workday HR System for further processing.

2	IHL user needs to ensure the correct Time Entry Code and Project are used in sTMS.
3	Claimable hours would be integrated by the EIB timesheet report.
4	Non-claimable training hours will be sent to Workday in a separate template.
5	sTMS would generate the EIB and non-claimable training hours files for individual IHLs. EIB report will be sent to workday by API, and non-claimable training hour files will be pushed into SFTP.

Please refer to sTMS stage3 functional specification – section 4.5 Workday Integration for the details of the business process/rule.

10. Workday Finance System

10.1 Introduction

This Interface Functional Specification (IFS) is to provide the agreed baseline of communication requirements and detailed technical specifications between the SaaS shared Training Management System (sTMS) and Workday Finance System.

This Workday Finance System interface specification would be further split into two parts:

1. sTMS will retrieve all worktags for all respective IHLs. **Any creation and changes to worktag would be recorded.**
2. The retrieved worktags and information would be used for the respective rates configuration and accounting entries used in sTMS, such as Student Service, Disciplinary, Doubtful Debt Rule etc. Upon completed transaction and billing, journal entries would be created and updated and synced to Workday.

10.2 Overview

10.2.1 Overview - Workday Worktag

sTMS would be retrieving all worktags from Workday via SFTP. Please refer to the following for a detailed description:

SN	Description
1	Workday Finance System would push the worktag to sTMS SFTP by CSV file daily.
2	sTMS pulls the data from sTMS SFTP daily at 01:00am.

10.2.2 Overview - Workday Journal Entry/Adhoc Bank Transactions

sTMS would be sending all accounting transactions (including billing, payment of invoice, refund, award, payment of grant contribution, award disbursement, revenue deferment) completed to Workday Finance via API. Please refer to the following for a detailed description:

SN	Description
1	sTMS would send the unposted accounting journals for non-bank related transactions to workday by API per the interval configured in sTMS
2	sTMS would send the unposted bank related transactions (including payment collected in sTMS, settlement run completed via bank file generated in sTMS, payment gateway transaction fees for settlement in sTMS) to workday by API per the interval configured in sTMS

10.3 Integration – Worktag

10.3.1 Business Rule

No.	Business Rule
1	sTMS would retrieve the latest full worktags from Workday Finance System daily.
3	Each IHL will have a separate interface file generated for Worktags and other information.

Please refer to sTMS stage3 functional specification – section 12.2 Accounting Entries / Workday Integration for the details of the business process/rule.

10.4 Integration – Journal Entry/AHBT

10.4.1 Business Rule

No.	Business Rule
1	sTMS journal entries and ad-hoc bank transactions will be synced to Workday on a daily basis. For urgent cases, IHLs can manually export the entry and integrated with Workday.
2	Journal entries can be automatically created in Workday based on the transaction’s workflow in sTMS.
3	In the scenario where IHLs will send draft statuses to Workday, these draft records would be recorded as FND_99999 under “BalancingWorktagReferenceIDType”.

Please refer to sTMS stage3 functional specification – section 12.2 Accounting Entries / Workday Integration for the details of the business process/rule.
